TITLE: \Solid Lubricant Coatings

PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1960, №.7,
pp. 24-29

TEXT: Published work, mostly foreign, on solid lubricants is briefly reviewed. The original experimental work described here was concerned with molybdenum disulphide. Solid lubricants have poor protective properties, the lubricating film if once damaged may not be easily replaced and they do not extract heat. Their service life may be increased by binding them to the metallic surface by appropriate treatment. Very finely divided powders are necessary to secure good adhesion to metals. The surface to be treated must also be of good finish and the present tests were made with surface finishes classes 10 to 12, i.e. with average height of roughness of 0.05 to 0.1 microns. The usual methods of depositing solid lubricants on metal surfaces are described. The choice of binder is discussed, the most heat resistant resins produced in the USSR being silicone and combinations of silicones with acrylic and

Card 1/3

84981

E194/E484**Solid Lubricant Coatings**

epoxide polymers. The hardening treatment used depended on the properties of the binder, the temperatures ranged from 150 to 350°C, depending on the resin used. The choice of solvent for deposition of resin and solid lubricant is important, ethanol was used in the tests because it is particularly convenient for use with the molybdenum disulphide which was used. Data on the permissible dilution of the resin with ethanol is given in Table 1. Tests were made with suspensions of molybdenum disulphide ranging in concentration from 6 to 37%, and the relationship between film thickness and molybdenum disulphide concentration is given in Table 2. Uniform films could not be obtained with molybdenum disulphide concentration below 10%. The adhesion of the solid lubricant coatings to metal surfaces was assessed by adhesiometers of the Deryagin and Orlov systems, by a press tool and in other ways. However, difficulty was experienced in making the assessment because the film could not be removed as a thin sheet. Information about resistance of the coating to rubbing was obtained in an instrument in which a shaft rotating at constant speed is pressed against a sheet coated with solid lubricant. As soon as the film of solid

E194/E484

Solid Lubricant Coatings

lubricant is worn off there is metal to metal contact and a lamp is lit. The time required to break down is a criterion of mechanical strength of film. Test results with molybdenum disulphide films ranging from 1 to 39 microns thick are given in Tables 3 and 4. Further results obtained in a Timken tester are given in Table 4. It is shown that the quality of the film depends on the nature of the binder, the method of deposition of the film, the conditions of hardening and the thickness of the film. There are 1 figure, 4 tables and 10 references; 4 Soviet (one of them probably translated from English), 4 English and 2 German.

TITLE: Solid high temperature high vacuum greases

PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1961, No.7,
pp.13-16

TEXT: An experimental study has provided the optimum method of applying molybdenum disulphide to metallic surfaces as a lubricant. The films are stable up to decomposition temperatures which depend on the nature and pressure of the gas as follows: inert gas, at atmospheric pressure, up to 1300°C; in air, at atmospheric pressure, 45°C; 800° at 10^{-4} mm Hg; 900° at 10^{-5} mm Hg; 1100° at 10^{-6} mm Hg. The purity of the MoS₂ used was 99.5%. The poor adhesion properties of MoS₂ were best overcome by washing the metal surfaces in alkali to remove oxide films, and then spraying on a solution of MoS₂. The nozzle to metal distance is fairly critical, the optimum being established at about 20 cm. Several types of solvent were tested: 1. those strongly adhering to metal (BMK-5 (BMK-5), 3-41 (E-41)) (nitrocellulose); 2. those with carbonaceous ash on heating (K-2-12-01, 3-116 (E116)).

TITLE: Molybdenum disulfide-based solid lubricants 11.44
SOURCE: Khimiya i tekhnologiya topliv i masel, no. 11, 1965, 41-45
TOPIC TAGS: solid lubricant, molybdenum disulfide, lubricant performance
ABSTRACT: The All-Union Scientific Research Institute for Oil and Gas Refining and the Production of Synthetic Fuel (VNII NP) has developed several MoS₂-based solid lubricants. These VNII NP brand lubricants are produced in the form of finely divided powders, solid compacts, pastes or solid lubricant coatings. The lubricants (whose composition is not given) and their applications are tabulated in the source. Service life and antifriction properties were studied for the solid lubricant coatings. There are suspensions of MoS₂ in such solvents as methyl alcohol, water, or butyl acetate with organic (VNII NP-212 and -230) or organosilicon or inorganic (VNII NP-209, -213, and -229) film-forming additives. The experiments were conducted in air, vacuum (10^{-5} torr), argon, and at -224 and 0-700C. In addition, the effect of Co⁶⁰ irradiation was studied under static conditions. The testing methods are described in the source. The results of the study, given in the form of tables and graphs, indicate that the service life of the solid lubricant coatings is longest at

ACC NR: AP5027588

100—200C; it is sharply shortened above 300C. VNII NP-212 and -213 perform best in air both at room and high temperatures owing to better adhesion of organic film-forming additives to metals. The working temperatures of VNII NP-209, -213, and -229 increase to 500—600C at 10^{-5} torr and in argon. Low temperatures (-254C) and irradiation with a dose of 10^8 — 10^9 rad do not appreciably reduce the service life of solid lubricant coatings. The service life of these coatings decreases sharply in water or mineral oil. The performance of MoS₂-based solid lubricant coating is highly dependent on the preliminary treatment of the metal surfaces and the thoroughness of their degreasing. TITLE: Investigation of life and antifriction properties of solid lubricants

SOURCE: AN SSSR. Nauchnyy sovet po treniyu i smazkam. Teoriya smazochnogo deystviya i novyye materialy (Theory of lubricating action and new materials). Moscow, Izd-vo Nauka, 1965, 131-134

TOPIC TAGS: solid lubricant, lubricant property, molybdenum disulfide / VNII NP 212 lubricant, 213 lubricant, 229 lubricant, 230 solid lubricant

ABSTRACT: Four molybdenum-disulfide based solid lubricants developed by VNIINP, differing only by the type of film-producing substance used, were investigated for their life and antifriction properties. The destruction of the film producer was measured on apparatus PIM-2 as described by V. M. Martynov (Neftepererabotka i neftekhimiya. Sbornik, vyp. 8, M., Goskhimizdat, 1963) while the frictional stability was measured on apparatus ITK developed by Klimov (no reference given). The friction couple consists of a 5-mm diameter by 50-mm long roller and a ni-chrome strip (0.1 mm thick by 4.5 mm wide) which is loaded with 300 gm (included angle of 120°) against the roller rotating at 800 rpm; the strip moves at 4 mm/min

Card 1/4

L 00318-66

ACCESSION NR: AT5020437

10

with respect to the roller, giving a sliding speed of 0.21 m/sec; the coefficient of friction μ is determined by torque measurement. After sand blasting and parkerizing, the steel surface was coated 20 micron thick with VNII NP-212 (K-41 102 - ureaformaldehyde resin film producer), 2213 (K-55 silico-organic resin), 15-229 (sodium silicate), or -230 (EP-096 epoxy resin) lubricants. Weight loss and friction characteristics were determined as a function of temperature (150-400C). It was found that the weight loss (based on 30-minute test) of the organic binders EP-096 and K-41 102 was higher (up to 20% at 200-350C) than that for nonorganic K-55 and Ka_2SiO_2 (5-6% at 300-350C). The life and friction coefficient curves (see Figs. 1 and 2 on the Enclosure) were found to have maxima and minima respectively at $\approx 100C$. Orig. art. has: 4 figures and 1 table.

TITLE: Dry lubricants with molybdenum disulfide, and the lowering of instrument
wearSOURCE: Mashinostroitel', no. 1, 1966, 30-31TOPIC TAGS: lubricant, lubricant additive, lubricant component, high temperature
lubricant, molybdenum disulfide / NP-229 lubricant

ABSTRACT: This is a comment on a paper previously published by M. S. Beletskiy, I. Ts. Raykhenshteyn, and O. K. Shatalova (Mashinostroitel' No. 7, 1965), in which those authors disputed the claim of Ya. K. Terent'yev that the solid lubricant (developed by him and containing MoS_2) had any wear-resistant properties. The present authors point out that by mixing MoS_2 with a suitable lacquer or resin it is possible to create a thin protective layer on the surface of cutting tools. Attention is drawn to several such lubricants developed by the All-Union Scientific Research Institute for Reprocessing of Petroleum (Vsesoyuznyy nauchno-issledovatel'skiy institut po pererabotke nefti) (in particular, lubricant VNII)

TITLE: Effect of temperature on the service life of solid film lubricants

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 10, 1966, 46-51

TOPIC TAGS: solid film lubricant, thermal oxidative stability, service life, friction coefficient, film forming material, additive

ABSTRACT: A study has been made of the effect of temperature on the thermal-oxidative stability and service life [in air] of solid film lubricants based on certain organic and inorganic film-forming materials (see Table 1) which contain MoS₂ or graphite additives [percentage unspecified]. The thermal-oxidative stability of the materials was estimated from weight loss on the PIM-2 apparatus described previously (Martynov, V. M. Neftepererabotka i neftekhimika, no. 8, 1963). Unlike the urea-formaldehyde film-forming material, the organosilicon and epoxy materials and, in particular, Na₂SiO₂, were shown to exhibit high thermal-oxidative stability at 300—350°C. This stability was considerably improved by the addition of MoS₂. The service life (τ) and friction coefficient (μ) of the films were determined on the ITK apparatus described previously (Sentyurina, L. N. et al. Teoriya smazochnogo deystviya. Izd. Nauka 1965). The μ was low for films based on organofluorine or organic

film-forming materials and higher for those based on organosilicon or inorganic materials. The μ of films based on film-forming materials belonging to a given class of chemical compounds varied but slightly. In contrast, τ was shown to depend on the molecular weight of the film-forming material and on the presence of surface-active groups. The τ was higher for films based on organic materials than for films based on inorganic materials. The functions $\tau = f(t^\circ)$ and $\mu = f(t^\circ)$ exhibited extrema; the highest τ and the lowest μ were observed at 100—200°C. Study of the effect of additives showed that at 40—300°C, solid film lubricants containing graphite had lower τ and μ than those containing MoS₂. τ and μ were intermediate for films containing a graphite -- MoS₂ mixture (1/9 ratio). Cycling from room to a subzero temperature had almost no effect on τ and μ [a discrepancy is found between the subzero temperature quoted in the text (-25°C) and in Table 4 (-250°C) of the original article] Film thickness did not affect τ . No direct correlation could be established between thermal-oxidative stability and τ . Orig. art. has 6 figures and 4 tables.

Title : The Optimum Conditions for Ripening of Cream Used in Latvian Butter.

Orig Pub : Tr. Latv. S-Kh. Akad., 1957, Vyp. 6, 495-504

Abstract : To prepare Latvian butter by means of ripening techniques, it is recommended that the physical ripening of cream take place for six hours at 6° C, after which time it is allowed to become sour at 10-12° C, while attaining a certain degree of acidity. If necessary, the cream is first made sour at 10-12° C (with a decrease in time to 14-16 hours), and after it attains the required acidity, the physical ripeness is carried out for 2 hours at 2° C. When butter is made sour at 18-20° C, it has inferior taste and flavor.

TITLE: More About Training Farms (Yeshchë raz ob uchebno - opytnykh
khozyaystvakh)

PERIODICAL: Professional'no - Tekhnicheskoye Obrazovaniye, 1957, Nr. 9(148)
pp. 20-21 (USSR)

ABSTRACT: The article is a response to an essay of I. Kiparenko which
appeared in Nr. 4, 1957, of this periodical. The author
emphasizes the necessity for good theoretical knowledge and
thorough practical training of graduating mechanizers. He
points out the deficiencies of the present system of practical
training where groups of students are assigned to MTS tractor
brigades, 5-15 km away from each other. In order to solve the
problem, the Klyuchevskoye School of Agricultural Mechanization
of the Altay Kray (Klyuchevskoye uchilishche mekhanizatsii
sel'skogo khozyaystva Altayskogo kraya), and other schools,
sent 1 or 2 groups to 200 - 300 ha farms where it was proved
that practical training can be well organized. He shares
Kiparenko's opinion to extensive training farms of 2,000 to

Card 1/2

More About Training Farms

27-9-13/30

3,000 ha being placed at the schools' disposal provided it is grain growing soil. The author quotes the Klyuchevskoye School of Mechanization as an example, while the Inin School of Agricultural Mechanization (Ininskoye uchilishche mekhanizatsii sel'skogo khozyaystva), situated in the Gorno-Altay Autonomous Oblast (Gorno-Altayskaya avtonomnaya oblast) 1,200 m above sea level and raising primarily livestock would not be able to work such a big farm. He points to the tens of thousand of tractors and combines staying idle at the schools at the busiest time of agricultural work, and quotes five problems which would be solved if large training farms were set-up. The article cites one Slavic reference.

Biochemical changes in heart and aorta during growth. A. A. RUGAHLIAN and A. A. SHURAVSKAJA (*Ukrain. Biochem. J.*, 1939, 16, 501—517).—The water content of rabbit heart muscle falls from 81% at the age of 10 days to 77% at 155 days. The cholesterol content falls to a min. at 90 days, then rises slowly to the 150th day, and subsequently increases more rapidly; the lipin content rises after the 150th day. Total and non-protein-N rise to a max. on the 60th, and are min. on the 90th day, thereafter rising slowly to the 150th day, and rapidly after this. Polypeptide-N varies similarly, except that the min. is at 150 days. Variations in the cholesterol and lipin contents of the aorta are parallel to those in the heart; total and non-protein-N fall to a min. on the 30th day, rise to a max. on the 60th day, and again fall to a min. on the 90th day, then rising continuously. Polypeptide-N varies similarly, except that the second min. is on the 140th day.

TITLE: Magnetostriiction ferrite. Class 21, No. 153755

SOURCE: Byul. izobret. i tovarn. znakov, no. 7, 1963, 19

TOPIC TAGS: magnetostriiction ferrite, ferrite, ferric oxide, cobalt oxide, nickel oxide, copper

ABSTRACT: This Author Certificate was issued for a magnetostriiction ferrite made from solid solutions of nickel and cobalt salts designed to ensure temperature stability of the resonant frequency and constant electromechanical coupling coefficient in the +60 to -60°C temperature range. The ferrite was prepared from 50-55 mol% Fe₂O₃, 0.2-0.4 mol% CoO, 42-47 mol% NiO, and an admixture of 2-5 mol% copper.

TITLE: Experimental Investigation of the Compensatory Effectiveness of Corrugated Expansion Joints (for Conduits) Eksperimental'noye issledovaniye kompensiruyushchey sposobnosti linzovykh kompensatorov (truboprovodov)

PERIODICAL: Tr. Vses. n.-i. in-ta po str-vu ob'yektov neft. i gazovoy prom-sti, 1954, Nr 6, pp 47-60

ABSTRACT. The calculation method for corrugated expansion joints proposed by S. N. Sokolov is examined. In the stress analysis of corrugated expansion joints the calculation of a toroid shell is replaced by that of annular plates fixed along their external and internal contour. It is assumed that the relationship between an axial loading and the yielding of the expansion joint constitutes a broken line consisting of three segments. In the first segment the straight line passes through the origin of the coordinates with a certain slope; in the second segment the straight line runs parallel to the axis of the yielding; in the last segment a linear increase in strength takes place. Fundamental calculation formulas

Card 1/2

124-57-2-2189

Experimental Investigation of the Compensatory Effectiveness (cont.)

are adduced for the determination of the minimal wall thickness of the corrugations, the permissible yield of an expansion joint, and the forces that correspond to that yield. The dimensions and types of expansion joints that were tested for axial compression and internal pressure are indicated; a description is also offered of a special test stand on which the tests were performed with the aid, in specific cases, of lever-type strain gages. The results obtained are analyzed.

TITLE: Dependence of the heat effects occurring on polymer dissolution on the nature of the solvent

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 149, no. 1, 1963, 128 - 130

TEXT: The dissolution heat of CKc-30A (SKS-30A) divinyl styrene copolymer and CK4-26 (SKN-26) divinyl nitrile copolymer was determined together with the contraction Δv of the solution in ditolyl methane, dicumyl methane, dibutyl sebacinate, and dibutyl phthalate. The equation

$Q = -E_{11} - E_{22} + 2E_{12}$ (1) where E_{11} , E_{22} , E_{12} respectively denote the interaction of the molecules of the solvent, the polymer and the solvent plus polymer was found to be wrong. The nonpolar SKS-30A showed high heat effects in solvents with high dipole moment, the polar SKN-26 showed maximum heat effects in the weakly polar ditolyl methane and lesser heat effect in strongly polar solvents. Therefrom it is concluded that Eq.(1) must be completed by a member E'_{22} taking account of the energy of the local bonds forming between the macromolecule links in the solution:

Card 1/2

S/020/63/149/001/017/023

B101/B144

Dependence of the heat...

$Q = -E_{11} - E_{22} + 2E_{12} + E'_{22}$ (2). The bond between the links is manifest, e.g., from the contraction of SKN-26 solution in solvents with high dipole moment corresponding to coiling of the macromolecules. In SKS-30A, the intrinsic viscosity decreases when the dipole moment of the solvent increases. The effect of the plasticizer on the flow point is discussed. Addition of ditolyl methane, dibutyl sebacinate or dibutyl phthalate reduces gradually the flow point of SKS-30A. Small additions (1.5 %) of dicumyl methane increase the flow point, greater additions reduce it again. This may be important for the plasticizing of polymers and for fiber formation. There are 1 figure and 2 tables.

TITLE:

Catalytic Oxidation of Cyclohexane With Compressed Air
by the Continuous Method

PERIODICAL: Khimicheskaya promyshlennost', 1960, No. 4, pp. 1-8

TEXT: I. M. Rozenfel'd, A. A. Lavrichenko, I. L. Vaysman, N. K.
Zhitnikova, and the personnel of the pilot plant of the Gubakhinskiy
khimicheskiy zavod (Gubakha Chemical Works) took part in the work
described here. The said pilot plant was set up for the experiments
under discussion, and is schematically reproduced in Fig. . The long-
lasting continuous operation of this pilot plant for the oxidation of
cyclohexane with atmospheric oxygen under pressure yielded the following
results among others: At a pressure of 18-24 atm, a temperature of
130-140°C, and with cobalt stearate serving as a catalyst in a ✓

Card 1/3

Catalytic Oxidation of Cyclohexane With

B015/B060

concentration of 3 g per 100 l of cyclohexane, the conversion of cyclohexane amounts to 10-12% in one passage, and the yield of anone, anol, and adipic acid is 80-85% (of the reacted cyclohexane). Water and benzene reduce the oxidation rate. Slowing down the air supply improves the exploitation of oxygen. Apart from adipic acid, there develop succinic, glutaric, and oxalic acids, with the part by weight of low dicarboxylic acids amounting to about 20% of the total amount of organic acids. The process of dehydrogenation of cyclohexanol (which was obtained by oxidation of cyclohexane) was studied on a continuously working pilot plant (Fig. 4) (with the assistance of V. U. Roshal'), and was compared with the results obtained from cyclohexanol produced from phenol (Table 1). On a pilot plant (Fig. 5) the authors worked out a scheme (Table 2) for separating the products obtained from the oxidation of cyclohexane. The products obtained corresponded, as to their quality, to the analogous products obtained in the production of caprolactam from phenol. N. I. Chernczukov, S. E. Kreyn, K. I. Ivanov, I. V. Berezin, Ye. T. Denisov, N. M. Emanuel', A. I. Finkel'steyn, Candidate of Chemical Sciences, and L. Kh. Freydlin are mentioned in the paper.

AUTHORS: Olevskiy, V. M., Ruchinskiy, V. R.

TITLE: Use of film columns with plane-parallel plates for separating the oxidation products of cyclohexane by means of rectification

PERIODICAL: Khimicheskaya promyshlennost', no. 1, 1961, 57-62

TEXT: In the production of caprolactam and adipic acid, the separation of the oxidation products of cyclohexane makes it necessary to distill off large quantities of liquid. This distillation must be done at very low temperatures and pressures so as to avoid resin formation. The authors describe highly efficient pellicular columns with plane-parallel inserts exhibiting a low hydraulic resistance. They determined the efficiency and hydraulic resistance during the distillation of unused cyclohexane at atmospheric pressure, and during vacuum rectification of a mixture of cyclohexanone-cyclohexanol with oil. The experimental unit is shown in Fig. 1, and the reflux regulator in Fig. 2. The plates of the plane-

Card 1/9

Use of film columns with plane-parallel...

parallel insert have a thickness of 5 mm and are made of ordinary sheet metal as used for roofing. They are covered with fine wire grids which, owing to their capillary action, bring about a better liquid distribution. Sixteen inserts of plane-parallel plates with a height of 710 mm are installed inside the column at a distance of 7 mm from each other. The maximum wash intensity was found to be 800 l/hr, which corresponds to a load of 266 kg/m sec referred to 1 m² of the plate, or to 45.2 m³/m² hr of the linear vapor velocity w_g^* = 3.36 m/sec, in which case overloading occurs at a Reynolds number in the gaseous phase of $Reg = 16,700$. However, when ordinary plate columns are used, this overload is attained at $w_g^* = 0.78$ m/sec (vapor velocity four times lower). Another advantage of the new columns is the fact that no increase in resistance occurs near the maximum load, which is characteristic of conventional plate columns. For the dependence of the height equivalent of mass transfer on the Reynolds number, the general formula for calculating the diffusion resistance in the gaseous phase holds:

$$h_g = A Re^m (Pr')^n d^k. \text{ Here, } Pr' \text{ denotes the Prandtl diffusion criterion.}$$

Card 2/9

S/064/61/000/001/009/011
B132/B218

Use of film columns with plane-parallel...

The efficiency of plane-parallel inserts was determined experimentally by taking samples of the distillate, both in the concentrating and in the distilling section. A comparison showed excellent efficiency of the plane-parallel insert. Fig. 5 illustrates the dependence of the efficiency of plane-parallel inserts on Reg. The formula

$$h_g = \frac{H}{m_y} \text{ serves for calculating } h_g \text{ (height equivalent of mass-transfer}$$

unit together with the calculation of the entire diffusion resistance). Experiments were made with values of Re_g varying between 1,000 and 13,000, which corresponds to $w^g = 0.205\text{-}2.62 \text{ m/sec}$. Up to $Re_g = 8,000$, h_g increases uniformly and then remains almost constant up to $Re_g = 13,000$. Fig. 6 illustrates the dependence of the efficiency of the insert on Re_f (Reynolds number in the liquid phase) for the distilling section. Experimental results showed satisfactory efficiency of the plane-parallel inserts, even with a wash intensity that is ten times higher than in plate columns. When cyclohexane is distilled, the wash intensity in the distilling section is 2.6 times higher than in the concentration section. ✓

Card 3/9

S/064/61/000/001/009/011
B132/B218

Use of film columns with plane-parallel...

Such columns with plane-parallel inserts proved to be very efficient for vacuum rectification. Due to their low operating temperature, the formation of cyclohexylides and cyclohexanone-2 is excluded. Overload in this case occurs at 650 l/hr. As referred to plate surface, this corresponds to 278 kg/m hr or 38.96 m³/m² at a linear vapor velocity of $w_g = 12.65 \text{ m/sec}$ (these indications correspond to a Reynolds number of $Re_g = 17,200$). 15 transfer units are necessary for rectification at 60 mm Hg and a reflux number of 3.5. In this case, the total height of the insert amounts to 20 m; the resistance of the column varies from 25 to 40 mm Hg. There are 7 figures and 18 references: 12 Soviet-bloc and 6 non-Soviet-bloc.

AUTHOR: Ruchinskiy, V. R.

TITLE: Vsesoyuznoye soveshchaniye po teplo- i massoobmenu (All-Union Conference on Heat and Mass Exchange)

PERIODICAL: Khimicheskaya promyshlennost', no. 7, 1961, 72 - 73

TEXT: The above-mentioned Conference, organized on the initiative of the AS BSSR, Ministerstvo vysshego i srednego spetsial'nogo obrazovaniya SSSR (Ministry of Higher and Secondary Special Education, USSR), Akademiya Stroitel'stva i arkhitekturny SSSR (Academy of Civil Engineering and Architecture, USSR), Institut mehaniki AN SSSR (Institute of Mechanics, AS USSR) and Energeticheskiy institut im. G. M. Krzhizhanovskogo (Institute of Power Engineering imeni G. M. Krzhizhanovskiy), was held in Minsk from June 5 to 9, 1961. It was attended by scientists from Poland, Czechoslovakia, Hungary, the USA, Great Britain and the Netherlands. The following lectures were delivered at the plenary sessions: A. V. Lykov, on the application of the thermodynamics of irreversible processes for investigating heat and mass exchange in the boundary layer; S. S. Kutateladze, on

V. B. Kvash, on determining and warranting the optimum temperature field in chemical reactors, and I. P. Slobodyanik, on a new method for the analysis of chemical sorption in packed columns. The seventh section dealt with heat and mass exchange during drying processes; lectures were delivered in this connection by S. Endrényi (Hungary), Yu. A. Mikhaylov, M. F. Kazanskiy, P. P. Lutsik, V. N. Oleynikov, V. V. Krasnikov, V. A. Danilov, P. D. Lebedev and B. N. Leonchik. In the eighth section, lectures were delivered on heat and mass exchange in the manufacture of building materials, and the ninth section dealt with problems of determining thermophysical characteristics of various materials. In its resolutions, the Conference stated that the development of new machines and devices must be based on the latest achievements of thermics. Heat exchange and exchange of mass at very high flow rates, various phase changes, firing, chemical reactions etc. are pointed out, for which the thermodynamics of irreversible processes, the theory of the turbulent motion of nonisothermal and inhomogeneous currents, etc., must be developed.

Abstract : Two million units of penicillin and two million units of streptomycin dissolved in water and emulsified in 40 ml of oil, were introduced once daily for 4 consecutive days into the upper third of the prepuce followed by a massage of the latter. At the same time and periods, penicillin was intramuscularly injected in 4 thousand units dosages per 1 kg. By using this method of treatment, a complete recovery of the animals was achieved. -- A.D. Musin

Assonov, V. A., and L. A. Paporotskiy, Resp. Eds.

Novoye v sredstvakh i sposobakh vzryvaniya (New Developments in Blasting Means and Methods). Moscow, Gosgortekhizdat, 1962. 124 p. (Series: Vzryvnoye delo; Sbornik no. 48/5) Errata slip inserted. 3000 copies printed.

Sponsoring Agency: Nauchno-tehnicheskoye gornoye obshchestvo.

Ed. of Publishing House: A. Ya. Koston'yan; Tech. Eds.: L. I. Minsker and G. M. Il'inskaya.

PURPOSE: The book is intended for mining engineers, workers in scientific research and planning organizations, and also for teachers and students of mining and technical schools.

COVERAGE: This collection of articles describes new blasting means and methods, means of protecting electric detonators from stray currents, and improved methods of short-delay detonation.
